

TOWERGUARD Persistent Perimeter Awareness

A Malleus Prendere LLC product · SDVOSB / VOSB · AI-native perimeter intelligence platform

An autonomous multi-drone nest that keeps a perimeter under continuous watch. The drones are the sensor. The AI is the brain. The platform is the product.

THE PROBLEM

Guards tire and attention drifts. Cameras have blind spots. A single patrol drone goes offline 20–30 min to recharge. Coverage is episodic — and the gaps are where risk lives.

THE SOLUTION

An autonomous nest holds 3–4 low-cost drones in rotation. The platform flags anomalies; a human authorizes; manual takeover is one click away. Coverage becomes **persistent, not episodic**.

THE NEST — CONTINUOUS ROTATION

WT-01 Patrolling	WT-02 Ready (standby)	WT-03 Charging	WT-04 Maintenance / Reserve
---------------------	--------------------------	-------------------	--------------------------------

One drone always airborne, one ready, one charging, one in reserve — no recharge downtime, no coverage gaps.

WHY TOWERGUARD

- **Platform-first** — software orchestration is the durable asset; hardware is a commodity.
- **Sensor-agnostic** — drones, thermal, radar, RF feed one platform.
- **Scales 1 → 50 nests**; dual-use (commercial-first, government-ready).
- **Founder** — 20-yr Army veteran who stood the post.

MARKETS

Commercial: farms & ranches, warehouses/distribution, construction sites, office parks, private security firms.
Government: military installations, critical infrastructure, border security, corrections.

CAPABILITY ROADMAP

PHASE 1 — NOW • Autonomous patrol rotation • Anomaly detection + alerts • Manual takeover • Incident logging	PHASE 2 • Thermal / radar / RF detection • AI event classification • Guard dispatch workflows	PHASE 3 • Multi-site orchestration • Networked 1 → 50 nests • Cross-network AI
GOVERNMENT FIT Installation / base perimeter security, persistent ISR, force protection. Target programs: AFWERX Open Topic, DoD SBIR/STTR.	STAGE TowerGuard Sim — technical feasibility: a functional command-and-control prototype (telemetry simulation, mission dispatch, alerting, return-to-nest).
